

# Cylinder Carrying and Chocking Apparatus and Method

## Abstract

A carrier for a scuba tank or other cylindrical bottle comprises two cylindrical handles connected by a looped rope, the rope passing slidably through one of the handles. The scuba tank is supported by the ropes and carried by one handle looped through the rope. The handles may also be used to chock the tank against rolling in a vehicle, by placing the tank next to one handle and sliding the other handle up against the tank.
